WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

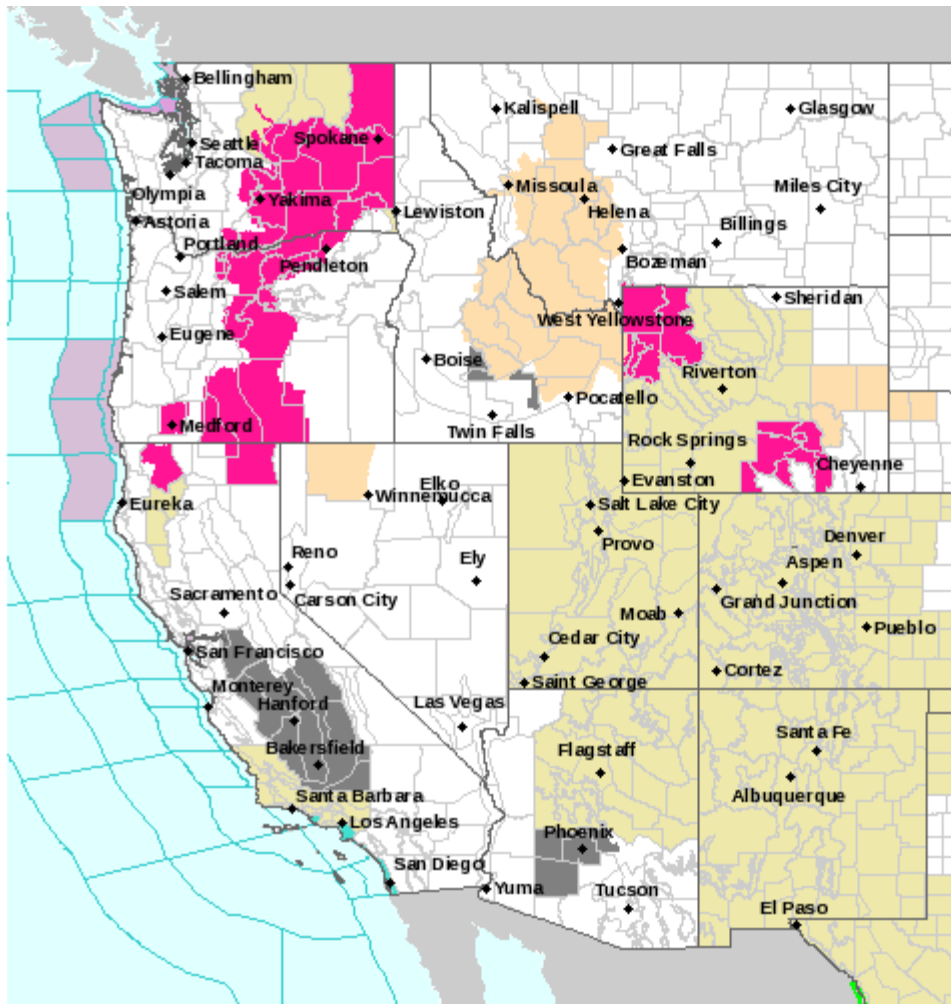

High pressure will weaken and move southeast and a low pressure trough will approach from the northwest on Sunday. Afternoon and evening thunderstorms will be more numerous over the higher terrain, but just about any location could see a stray thunderstorm. Even though these storms will produce some rainfall, dry strikes and new ignitions are possible. Due to the amount of lightning expected this is considered a High Risk event for the Northern Sierra and Far Eastside where thunderstorm activity will also continue later into the evening. A final round of Northern California thunderstorms is expected on Monday in eastern areas, and the Far Eastside will likely see more thunderstorm activity later in the day. Outflow winds from thunderstorms could gust to 50 mph. High pressure will push the moist unstable air off to the east Tuesday and Wednesday, and a new dry low pressure trough will develop overhead late in the week. Temperatures will continue to be around 10 degrees above normal in inland areas today, but drop to around 4-6 degrees above normal beginning Sunday. Overnight relative humidity (RH) recovery will still remain between 30-45% for many areas, especially mid and upper slopes and away from the marine layer. The marine layer will continue at about 1200-1800 ft. deep most days with daily overnight and morning low clouds and patchy fog pushing ashore furthest in the Humboldt Bay area and the greater Bay Area locations.

SOUTHERN CALIFORNIA

A weak area of low pressure off Point Conception will bring isolated to scattered afternoon thunderstorms to the Sierra and to the mountains and deserts of Southern California east of the I-15 Corridor through Sunday. The low will push inland Monday continuing the thunderstorm activity across the Sierra and the deserts bordering Nevada, but dry southwest flow aloft will end the thunderstorm threat across Southern California. Temperatures will be near normal through Monday, with upper 70s and 80s across the mountains and upper 80s and 90s in the valleys. Minimum humidity will be mainly between 12% and 25% away from the coastal areas through Monday. A ridge of high pressure will build into California from the southwest bringing a brief warming and drying trend to the region Tuesday and Wednesday. A weak trough will drop south from Canada bringing near normal temperatures and a little higher humidity to the area once again late next week. Winds will be normal for this time of year, except there will be strong and erratic winds in and near any thunderstorms.
